Innovatools What's On My Computer Product Information

Keep trojans, spyware and bad software off your computer!

How many times have you downloaded a file or application from the internet, only to wonder if it really is what it's supposed to be, whether it's safe, legitimate or dangerous? Perhaps you want to find out more information before installing it, or even about the company behind it, but just don't know where to look?

And even if the software is virus-free and doesn't pose any threats to the security of your software, is it full of bugs? Will it risk damaging your system?

What's On My Computer is your source of answers to all these questions and much, much more.

Is your computer secure? Is it infected? Are you being spied on?

Open your task manager, and may well be in for a surprise! Chances are that there are far more applications running right now than you realised.

Some are legitimate, and may be applications that you yourself want to be running. Some may be part of the windows system itself. And some may be constantly running background applications such as virus scanning and a firewall. Some, however, may be uninvited, unwanted, and possibly may even be compromising your system.

The question is... how are you supposed to know the good from the bad? How are you supposed to recognise the apps that should be starting, and those that might even be stealing your data as you read this!

And what about the programs installed on your computer? And all those executable files on your hard disk, are they part of legitimate software that you want on my computer, or are they viruses, trojans or spy programs?

Let What's On My Computer be the answer to all your questions and concerns, and show you all the information you might possibly want about each. What's On My Computer will be your means of confirming and checking their identity, and finding out everything about them, quickly and easily.

The easy way to solve problems and find answers

If you want information on a particular program, component or file you're having problems with, then What's On My Computer will make quick and easy work of searching the Internet. No need to install and configure complicated software to search through newsgroups, FAQs and Q&As; let What's On My Computer do the work for you.

An easy way to find support and updates for your programs

Software is often improved and updated on a continual basis, and many newer versions are not only free, but offer improved features and stability, and may even fix issues that have been troubling you for some time.

Finding them is often difficult, confusing and time-consuming. What's On My Computer takes the pain out of the process and does the work for you. Just select the program in What's On My Computer and search. That's all there is to it.

An easy way to find help and documentation on any item on your computer

Just select any file, folder, program, shortcut, Control Panel item, font, printer, disk, registry key, etc. You can use What's On My Computer to easily access an assortment of information regarding that item over the Internet, without the pain and endless trawling of wading through the search engines.

Easy to use

Using What's On My Computer quite literally couldn't be any easier.

Step 1: Select the file, folder, program or other item from your computer that you want to know what it is or get more information about. What's On My Computer will display the item's properties, such as name, path, type etc.

Step 2: Click the Go button located to the right of the Search field. The Search field allows you to search by various properties of the selected file, folder, program or other item (by name, location on your computer, company or version information, etc.).

**Intuitive interface**

Forget the usual learning-curve associated with new software. What's On My Computer is designed to be as fast, simple and intuitive as possible, and you'll be benefiting from it's wealth of features in minutes.
